

Coreldraw How To Convert Fonts Outlines

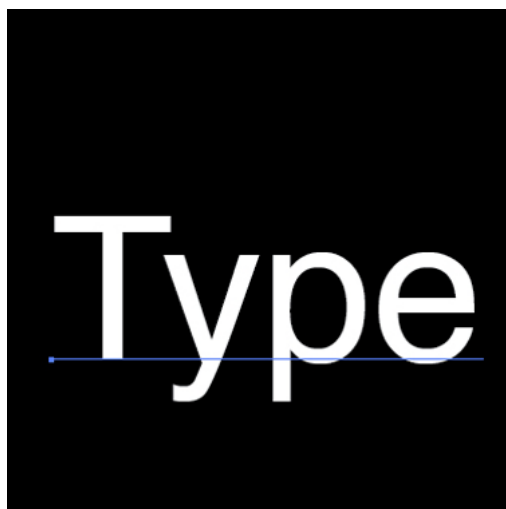

To prevent your fonts from shifting when you send your file to print, you want to convert any editable type to outlines.

To do this in CorelDRAW, is pretty similar as other programs but follow along and learn.

First, select all the type in your file. Go to the top menu under Arrange, select Convert to Curves.

You can also achieve this by right clicking the object and selecting Convert to Curves in that menu.

And that's it! You've successfully converted your type to outlines. You can now send your file to print without fear of the font shifting.
